OBJECTIVE

Sophomore Human-Centered Engineering Design student (Electrical Engineering Design concentration) at UM-Dearborn seeking a Summer 2027 internship in automotive UX, human factors, or HMI design.

EDUCATION

University of Michigan-Dearborn *Dearborn, MI*
Bachelor of Science in Engineering, Human-Centered Engineering Design — Concentration in Electrical Engineering Design
GPA: 3.17 | Sophomore | Expected Graduation: 2029

TECHNICAL SKILLS

Human-Centered Design: Design Thinking, User-Centered Research, Data Visualization, Cross-Functional Team Collaboration

Design & Engineering: Fusion 360 (CAD & Simulation), MATLAB, Arduino IDE, Circuit Prototyping

Software: Microsoft Office Suite (Word, Excel, PowerPoint)

RELEVANT COURSEWORK

Intro to Engineering & Design (ENGR 100) · Design Thinking: Process, Methods & Practice (ENGR 360) · Engineering Design Communication (HCED 220) · Technical Writing for Engineers (COMP 270) · General Physics I & Lab (PHYS 150/150L) · Calculus I & II (MATH 115/116) · Anatomy & Physiology for Engineers (BENG 200)

WORK EXPERIENCE

Cashier — Lowe's Companies, Inc. *Jul 2026 – Present*
Part-time | On-site

- Process customer transactions accurately in a fast-paced retail environment while providing reliable, friendly service.
- Assist customers with product questions and support day-to-day store operations.

General Utility II (Cleaning) — The Henry Ford *Apr 2026 – Jun 2026*
Seasonal | On-site

- Maintained cleanliness and operational readiness of museum facilities and exhibit areas in a high-traffic public venue.
- Worked reliably within a team to meet daily maintenance standards.

ACADEMIC PROJECTS

Autonomous Line-Following Robot with Load Balancing *Fall 2025*
Team Project — 4 members | Fusion 360, Arduino IDE, IR Sensors, MATLAB

- Designed and 3D-printed a chassis in Fusion 360 that carried up to 250g without tipping; programmed autonomous line-following navigation in Arduino IDE using dual IR sensor feedback.
- Collaborated within a 4-person team through iterative build-test-debug cycles, using MATLAB to analyze 10+ test runs; delivered a robot that completed the track in under 60 seconds with zero load drops.

Heat Distribution Simulation in MATLAB *Fall 2025*
Team Project — 4 members | MATLAB

- Built a finite-difference heat conduction solver modeling steady-state temperature across a metal plate with variable edge conditions.
- Benchmarked convergence across 5 epsilon values and grid sizes to optimize the accuracy/runtime trade-off, and built color-mapped visualizations translating numerical data into clear, readable insights.
